## Ex. 5 - Deliberative Process

Page 6 of the “Draft Air Quality Conformity Technical Report” states:

“The approach to the air quality analysis has been documented throughout the I-70 East Project in the Air Quality Analysis Protocol and its updates. The procedures in this document [the protocol] have been reviewed through the Interagency Consultation process for each step in the NEPA process.”

Page 1 of the “Air Quality NEPA Comparison Technical Report” states,

## Ex. 5 - Deliberative Process

Through Interagency Consultation, it was confirmed that some of the content of the Final EIS need not be revised based on the updates noted above. Items not updated in this document include the emissions inventory of health-based National Ambient Air Quality Standards (NAAQS), mobile source air toxics (MSATs), and greenhouse gases (GHGs). In the Final EIS, the project examined regional emissions of these pollutants on a broad scale and followed FHWA guidance in *Interim Guidance Update on Mobile Source Air 5 Toxic Analysis in NEPA* (December 6, 2012).

## Ex. 5 - Deliberative Process

- Changes to the project design are minimal, so changes to results of analysis at the air quality study area level—which includes the entire project, as well as the surrounding local road network—would not be noticeable

- The regional air quality inventory analysis is primarily a trend-line comparison between project alternatives. The Final EIS adequately discusses these trends for the use of a NEPA comparison 14 and updates to the analysis for the ROD would not alter previously shown regional air quality trends
- The new GHG guidance states that projects that have published a Final EIS are not required to update their analysis

Comments/Observations

Hi Everyone,

## Ex. 5 - Deliberative Process

The FHWA/CDOT February 13, 2013 draft air quality modeling protocol is attached and I would point you to page 5, under the heading “**Season(s) to be modeled**” which notes:

“Because PM<sub>10</sub> (and CO) violations have typically occurred in the winter and the maintenance plans for these pollutants address wintertime conditions, the project team proposes modeling only the winter season. This will reduce the MOVES modeling workload by a factor of four while still modeling the —worst-case season for air quality in Denver.”

Russ, Timothy [Russ.Tim@epa.gov](mailto:Russ.Tim@epa.gov)

RE: I-70 East: Air Quality Coordination - Draft Air Quality Analysis (Revised 2/11/13): EPA  
Comments

EPA has reviewed the “Protocol Air Quality I-70East DEIS 11Feb13.pdf” (copy attached) and offers the following comments for your consideration (and apologies for not meeting the March 1<sup>st</sup> requested response date):

**A.) Section 3.1 Carbon Monoxide:** For CO hotspot modeling, the draft protocol indicates the following at the top of page 3:

“The conformity rule requires modeling of locations that are or will be at level of service D or worse. In the case of the I-70 project, this could be dozens of intersections. Because the project team is proposing to model only the worst-case location, the EPA Regional Administrator will need to approve this approach pursuant to 40 CFR §93.123(a)(1). Similar approval was sought and received for the streamlined approach used for CO hotspot modeling for the T-Rex project.”

## Ex. 5 - Deliberative Process

### “Denver’s Southeast Corridor project

This project involves the reconstruction and improvement of approximately 20 miles of I-25 and I-225 in the southeast portion of the Denver metro area. The project includes reconstruction and widening of the interstates, reconstruction of seven interchanges, replacement of 11 bridges, and construction of 19.7 miles of double-tracked light rail transit. The air quality scoping process for this project revealed that a literal application of the conformity rule’s hotspot modeling requirements (analysis of all locations at or expected to be at LOS D or worse) would necessitate modeling of 54 intersections. Modeling each of these locations for the 2008 opening day and the 2020 design year, for the Preferred Alternative and No-Action, and for a.m. and p.m. peak hours would have resulted in over 400 model runs.

In order to reduce the modeling workload, the Colorado Department of Transportation and its consultants worked through the interagency consultation process to identify an alternative analysis approach that would capture the worst-case intersections without the need for modeling all of them.<sup>32</sup> First, the project corridor was divided into two sections; a northern section, with high volumes and congestion, and a very narrow right-of-way bordered by residential development; and a southern section, with less congestion and a wider right-of-way. In the northern section, the four most congested interchanges were selected for modeling, for both 2008 and 2020. In the southern section, a “worst-case” interchange was selected for modeling, based on congestion, roadway geometry and traffic volumes. A single worst-case model run for this location combined 2008 CO emission rates with 2020 traffic volumes. As a further refinement, it was decided that only the Preferred Alternative in the EIS would be modeled initially; if this alternative did not result in violations of the CO NAAQS, the No-Action alternative would not be modeled. EPA’s Region 8 office in Denver approved this methodology in May 1999. Taken together, the refinements in this methodology are estimated to have reduced the modeling workload by 50 to 75%. No violations of the NAAQS for CO were predicted using the adopted screening procedure. *Southeast Corridor EIS Air Quality Analysis Technical Memorandum*, Carter & Burgess, June 1999.”

**B.) Section 4.2. PM<sub>10</sub> Quantitative Hotspot Analysis:** For the PM<sub>10</sub> hotspot modeling, the protocol indicates the following on page 7:

“After reviewing the locations of these three monitors on aerial photographs, the project team proposes to use Commerce City as the background monitor as it best captures the industrial PM<sub>10</sub> contributions in the project area and is a reasonable distance from the I-70 corridor (i.e., it may best reflect actual background concentrations, excluding I-70 impacts). It also may be appropriate to use a different monitor or interpolate between these and/or another monitor.”

## **Ex. 5 - Deliberative Process**

**C.) Section 4.5 Mobile Source Air Toxics:** On page 9 of the draft protocol, the following statement appears:

“CALPUFF is being used rather than AERMOD for the MSAT analysis because AERMOD is not supported for near-roadway applications of MSATs.”

## **Ex. 5 - Deliberative Process**

Page 1, section entitled “3 Changes Since the Final EIS” and page 2, first and second paragraphs which state the following:

Through Interagency Consultation, it was confirmed that some of the content of the Final EIS need not be revised based on the updates noted above. Items not updated in this document include the emissions inventory of health-based National Ambient Air Quality Standards (NAAQS), mobile source air toxics (MSATs), and greenhouse gases (GHGs). In the Final EIS, the project examined regional emissions of these pollutants on a broad scale and followed FHWA guidance in *Interim Guidance Update on Mobile Source Air 5 Toxic Analysis in NEPA* (December 6, 2012).

The Final EIS included an emissions inventory of atmospheric carbon dioxide for all alternatives discussed. Though there is new GHG guidance, Interagency Consultation with FHWA, EPA, and APCD confirmed that it is not necessary to repeat this analysis because of the following reasons:

- Changes to the project design are minimal, so changes to results of analysis at the air quality study area level—which includes the entire project, as well as the surrounding local road network—would not be noticeable
- The regional air quality inventory analysis is primarily a trend-line comparison between project alternatives. The Final EIS adequately discusses these trends for the use of a NEPA comparison 14 and updates to the analysis for the ROD would not alter previously shown regional air quality trends
- The new GHG guidance states that projects that have published a Final EIS are not required to update their analysis

Chris and Mike,

Could you also provide the scripts and/or intermediate tables that calculate the volume source emission rates from the MOVES output? It is important for us to understand how the cross-walk between MOVES links and AERMOD sources was performed.

Thanks,

-Chris
